### **ABSTRACT**

The identification of rural roads is important for a government in resource management and sustainable development, in order to maintain and increase their lifespan.

It appears that roads are either completely renovated or completely abandoned. What may be a relatively large area of reflection for road engineers. This requires collaboration between the institutions on the political, legal and scientific.

In recent years the damage noted on the roadways made of asphalt concrete are becoming more numerous and appear upon commissioning. These distortions can be caused by different stresses: heavy overload, the erosion of pavement due to heavy rain, etc..

In our contribution we'll expose the real case located in a wilaya of northern Algeria, composed mainly of rural and mountainous areas. We will analyze the method of design, durability, maintenance, cost of implementation and the management agreement by local agencies and a rural road.

Keywords: Rural Route, design, rehabilitation, sustainable development.
